### **DETAILED ACTION**

Claims 1-20 are presented for examination. This office action is in response to the amendment filed on 4-19-2004.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lathrop et al (5,097,427) in view of Lauzon (5,977,982), and further in view of Peercy et al (5,710,876).

Regarding claim 1, Lathrop et al discloses that the claimed feature of a method for applying texture mapping in per-pixel operations (See Abstract, Fig 1, col 2 line 60-col 4 line 25), the method comprising: receiving a plurality of parameters that are used to define a pixel value at a pixel in a primitive (See Abstract, Fig 1, col 2 line 60-col 4 line 25); selecting at least one parameter (i.e. illumination values) from the plurality of parameters (See Abstract, Fig 1, col 2 line 60-col 4 line 25, col 4 line 50-col 5 line 56), [substituting a texture value from a texture map in place of a values produced from an algorithm that uses the selected at least one parameter to determine a pixel value;]

Art Unit: 2672

determining a texture value for each of the selected parameters by accessing a set of textures, the texture value for the selected parameters varying over the primitive (See Abstract, Fig 1, col 2 line 60-col 4 line 25, col 4 line 50-col 5 line 56); determining (Combining Function in Fig 1) the pixel value by using the unselected parameters and the texture values over the primitive, wherein the set of unselected parameters are not texture values and the texture values are associated with the selected parameters. (See Abstract, Fig 1, col 2 line 60-col 4 line 25, col 4 line 50-col 5 line 56)

Lathrop et al does not specifically disclose that "determining the pixel value by using the unselected parameters with constant values and the selected parameters with varying texture values". However, Lauzon discloses such claimed feature of invention. ["Specifically...rendering engine 10 can be arranged in terms of components ["unselected parameters" in recited claims] which are constant, i.e.-do not change as a selected texture 50 is modified, and components ["selected parameters" in recited claims] which can change as a selected texture 50 is modified..." (See col 5 line 3-13, Also See Abstract line 6-16, col 2 line 17-col 4 line 6) It would have been obvious to one skilled in the art to incorporate the teaching of Lauzon into the teaching of Lathrop et al, in order to provide "reduced computational requirements and real time rendering in many circumstances" (See Abstract line 16-20 in Lauzon), as such improvement is also advantageously desirable in the teaching of Lathrop et al for providing a fast image processing by eliminating the unnecessary computation for unchanged scene or images

Art Unit: 2672

or to reducing the rendering time by eliminating the calculation for the contributions of lights in the scene during rendering.

Also, Lathrop et al does not explicitly discloses that "substituting a texture map value for a value produced from an algorithm that uses the parameter", as recited claim 1. however, such limitation is shown in the teaching of Peercy et al. [i.e. "the texture map may comprise a surface matrix at each texel, and can be used as a substitute for the surface matrix or alternately it can be used for texturing the set of colorimetric sensor values calculated from the surface matrix", "selected texels are used either to substitute for or to scale one or more of the surface's material properties, such as its diffuse color components" (See Abstract line 19-24, col 17 line 42-50) it would have been obvious to one skilled in the art to incorporate the teaching of Peercy et al into the teaching of Lathrop et al, in order to "provide a practical color rendering system for computer graphics that has sufficient speed for interactive graphics, and more accurately represents the objects in an image on a computer screen" (See col 3 line 16-20 in Peercy et al), as such improvement is also advantageously desirable in the teaching of Lathrop et al for generating properly represented pixel values in the processing of texture mapping.

Regarding claim 2, Lathrop et al discloses that displaying the generated pixel light value on a display device. (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Art Unit: 2672

Regarding claim 3, Lathrop et al discloses that the plurality of parameters includes per-primitive parameters, which are defined over the entire primitive. (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Regarding claim 4, Lathrop et al discloses that the primitive is a polygon. (See Abstract, Fig 1, col 2 line 20-35, col 2 line 60-col 4 line 25)

Regarding claim 5, Lathrop et al discloses that the plurality of parameters includes both scalar and vector parameters. (See Abstract, Fig 1, col 1 line 51-62, col 2 line 60-col 4 line 25)

Regarding claim 6, Lathrop et al discloses that the plurality of parameters includes one or more of emission material color, ambient material color, global ambient light color, attenuation factor, ambient light color, diffuse material color, diffuse light color, specular material color, specular light color, a surface normal vector, a specular exponent, an environment map color, and a shadow color. (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Regarding claim 7, Lathrop et al discloses that the operation of determining the texture value further comprises the operation of:

Art Unit: 2672

Receiving texture coordinates for accessing the set of textures (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Accessing the textures in response to the texture coordinates to generate the texture values. (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Regarding claim 8, Lathrop et al discloses that the accessed texture includes a plurality of texture elements, the method further comprising the operation of:

Filtering the accessed texture elements of the texture map onto the selected pixel to generate the texture value associated with the pixel (See Abstract, Fig 1, col 2 line 60-col 4 line 25, col 7 line 39-48)

Regarding claim 9, Lathrop et al discloses that a light value is generated for the pixel value by evaluating a lighting equation that is defined in terms of the plurality of parameters. (See Abstract, Fig 1, col 2 line 60-col 4 line 25)

Regarding claim 10, refer to the discussion for the claim 1 hereinabove, Lathrop et al discloses that the claimed feature of a device for generating per-pixel values of pixels in a primitive by using texture parameters, the pixel values of the pixels in the primitive being defined by a plurality of parameters, (See Abstract, Fig 1, col 2 line 60-col 4 line 25) the device comprising: a texture memory ["memory"] for storing a set of texture maps (See Abstract line 1); a texture unit [4] for receiving texture coordinates for accessing a set of selected texture maps in the texture memory, the set of selected

Art Unit: 2672

texture maps being associated with a set of selected parameters selected from among the plurality of parameters that define a pixel value in the primitive, the texture unit generating a texture value associated with the pixel from each of the selected texture maps, wherein the parameters that are not selected from the plurality of parameters define a set of unselected parameters; and a rendering unit for generating the pixel value in response to the texture values of the selected parameters and to the unselected parameters. (See Abstract, Fig 1, col 2 line 60-col 4 line 25, col 4 line 50-col 5 line 56)

Regarding claims 11-14, Claims 11-14 are respectively equivalent to claims 4,6,5 and 9, and thus the rejections to claims 4,6,5 and 9 hereinabove are also respectively applicable to claims 11-14, but applied in view of the rejections to base claim 10.

Regarding claim 15, Claim 15 is the corresponding computer graphics system of claim 1. Thus, the rejection to claim 1 hereinabove is also applicable to claim 15.

Regarding claims 16-20, Claims 16-20 are respectively equivalent to claims 6,5,9,4 and 8, and thus the rejections to claims 6,5,9,4 and 8 hereinabove are also respectively applicable to claims 16-20, but applied in view of the rejections to base claim 15.

## Response to Arguments/Amendment

Applicant's arguments with respect to claims 1-20 have been considered but are moot in view of the new ground(s) of rejection. In response to the applicant's argument that the cited references do not discloses "substituting a texture map value for a value produced from an algorithm that uses the parameter". The newly submitted reference (Peercy et al) clearly discloses such limitation. [i.e. "the texture map may comprise a surface matrix at each texel, and can be used as a substitute for the surface matrix or alternately it can be used for texturing the set of colorimetric sensor values calculated from the surface matrix", "selected texels are used either to substitute for or to scale one or more of the surface's material properties, such as its diffuse color components"] (See Abstract line 19-24, col 17 line 42-50) See the rejection hereinabove.

#### Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Daniel J. Chung whose telephone number is (703) 306-3419. He can normally be reached Monday-Thursday and alternate Fridays from 7:30am- 5:00pm. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael, Razavi, can be reached at (703) 305-4713.

Any response to this action should be mailed to:

Commissioner of Patents and Trademarks

Art Unit: 2672

Washington, D.C. 20231

or faxed to:

(703) 872-9306 (Central fax)

(703) 872-9314 (for Technology Center 2600 only)

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, Sixth Floor (Receptionist).

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Technology Center 2600 Customer Service Office whose telephone number is (703) 306-0377.
